

## **WEEK 1 –**

In the first week, I focused on understanding fundamental computer concepts and operating systems, exploring how files, folders, and processes are managed in Microsoft Windows and Linux. I practiced using the command line to navigate directories, inspect system configurations, and view running processes. I only focused on this first because even though I have knowledge on this things, it could be very confusing since that's what I actually experienced and these exercises helped me gain practical familiarity with system operations and prepare for identifying and analyzing digital evidence in forensic investigations.

## **WEEK2 –**

During my 2<sup>nd</sup> week I tried doing some challenge that I could find and visited websites like pico and tried it some of the challenge were okay and some of them are actually confusing and hard and because of that i didn't finish all of theme but because of these I searched through different types of platform on what I could do like youtube and I also doing some AI like chatgpt to do the challenge and help me

## **WEEK 3 –**

During this week its actually our schools intramurals so I was quite busy because I was an athlete because of this I could not do some research but was doing some ctf events and the event that I choose to participate in was love at first breach in tryhackme I did that I was able to finish more than half of the challenge but I could not finish 3 of them since its very confusing for me I was stuck there

## **WEEK 4 –**

I could not do the research I was supposed to do in week 3 so what I did was go to youtube and watch people what tools they use for their work in cybersecurity field and there I discovered them using wireshark and

tcpdump the wireshark was actually kind of interesting but the tcpdump I find it quite confusing really

Well in conclusion although my progress was not very long, I was able to take my first steps into network forensics by learning basic computer and networking concepts and exploring tools like Wireshark and tcpdump. Although my progress was limited and I only research a lot of stuff regarding this topic these experiences helped me understand the basics of capturing and analyzing network traffic. This gives me a starting point to gradually develop my skills in network forensics in the coming months.
